ZeroPEN

Veeam Backup & Recovery Penetration Testing

“Zero compromise.” — Find it before the attacker destroys your Veeam backups.

The problem: Veeam is the standard for enterprise backup — and the attacker’s number-one target. Flaws like CVE-2024-40711 and CVE-2023-27532 have been actively used by ransomware groups including Akira and Fog to take over Veeam servers and delete backups.

What ZeroPEN does

- Controlled simulation of the ransomware kill-chain against Veeam.
- Targets the VBR server, Enterprise Manager, Veeam ONE, config DB and repositories.
- Verifies immutability, RBAC and patch level; produces a Veeam hardening scorecard.
- Proves backup-neutralization and exfiltration capability — without causing real damage.

Four layers, zero compromise
